

Meeting 7 Notes 4/2/19 10-10:50am

All members present - minus Wyatt

Reviewed work from before spring break

1. Madi demoed front-end of all pages, fixed the navbar links and the add workout button so that the pages are all linked and display properly - no data passing/integration yet, this week Madi will start setting up the Milestone 5 document
2. Dom updated on where he is at with storing exercise data and figuring out how to put exercises onto the correct days of the week in the calendar view based on the date stored in the table - thinks that he has a way to do this reliably/efficiently and will be finished with this by Thursday
3. Scott updated on his get function for pulling user information from the database, got help from team members in putting this function into the database handler with the correct name and merging into git, now will be working on pulling the user information from the registration form and pushing it into the database using a post call and function in the database handler - this will be done by next meeting
4. Dan helped Scott get set up on database handler functions and merging his code into git, also thinking through the post call for the registration page, he is also working on user authentication, will hopefully have authentication/sign in working by next week (logging in as an already created user to the web app)
5. Team is assuming that Wyatt is working on pulling exercise information from the database and putting it in cards into the calendar view on the home page using the get functions in the index route - will check in and make adjustments to other team responsibilities on Thursday depending on how this task is going
